

SEG +1 is a patented mag follower replacement that Automatically stops the bolt carrier and saves the last round in the chamber.

NOTE: as it saves a round in the chamber even when the operator thinks he reached the end of a current magazine, your gun is always loaded with another bullet **PLEASE** handle your gun carefully.

Know your tools

NOT all mags are alike, this follower fits only standard metal AK-47 and CAA polymer mags
DO NOT use on an uncertified magazine!

Your AK magazine is comprised with four (4) parts:

1. The body
2. A spring
3. A bottom cap
4. A follower

Step 1: safety

1. Make sure your gun is clear of bullets, without a mag inside, placed in a safe place pointing a safe direction. the magazine is out of the gun and empty of any ammunition. No bullets should be in the mag while replacing the follower.
2. The spring is under high compression, to avoid any injury, do not point the bottom of the mag toward face or other vulnerable parts
3. Read all of the instructions before disassembling the mag

Step 2: remove spring

1. Hold the magazine up side down, and using a hard object such as a screw-driver (do not use a live bullet) press the small Button at the bottom cap.
2. While pressing, slide the cap off
3. While removing the cap, hold the spring with your hands to prevent him from flying off
4. Hold the spring with your other hand and remove it slowly

Secure the spring while removing cap

Hold firmly and remove spring slowly

Step 3: replace the follower

1. Take off the old follower and position the new SEG+1 follower at the same orientation.

Step 4: assembling

1. Insert the follower and the spring back into the mag body. (you can also slide the follower and then insert the spring)
2. Use your fingers to compress the spring back and hold it firmly with your hand
3. Slide the bottom cap back on while holding the spring.
4. That's it, mag is ready.
